

Tri-Reo®

DESCRIPTION

Tri-Reo® is a multivalent inactivated virus vaccine for the immunization of chickens against clinical signs and lesions associated with Avian Reovirus infection

COMPOSITION

Inactivated Avian Reovirus vaccine containing strains 1133, 2408 and 3005

INDICATIONS

Tri-Reo® is recommended for the subcutaneous or intramuscular revaccination of healthy chickens 10 weeks-of age against clinical signs and lesions associated with avian reovirus infections.

Progeny of vaccinates are helped in the prevention of clinical signs of malabsorption associated with reovirus disease via maternal antibodies.

VACCINATION PROGRAM

Inject healthy chickens 10 weeks-of-age intramuscularly or subcutaneously (in the lower neck region) using aseptic technique.

For best protection, it is essential to prime the birds at least once with live Avian Reovirus vaccine for the protection against tenosynovitis.

Dosage: 0.5 mL per bird.

METHOD OF ADMINISTRATION

Intramuscularly or subcutaneously (in the lower neck region)

PRESENTATION

500 mL (1,000 doses) bottles

STORAGE

Store in the dark at 2°C to 7°C
