

Duck Plague Vaccine, Live

SYSZ (2006) No 150132024

[Ingredients and Concentration]

Weak strain of chicken embryonated duck plague. Cell virus concentration per dose ≥ 0.005 ml.

[Properties] The product appears mild yellow spongiform and loose ball in shape, is easily detached from vial wall and is solved rapidly after adding diluent.

[Functions and Uses] It is used for duck plague. Immunity appears 3-4 days after vaccination with the immunity duration of 9 months over 2-month-old ducks and 1 month in newly hatched ducklings.

[Application and Dosage]

Muscular injection. The product is diluted with sterile normal saline according to vial label. The adult ducks are inoculated muscularly in the leg with 1 ml/bird and the duckling with 0.25 ml/bird containing one dose.

[Adverse Reaction] No adverse reaction is noted generally.

[Precautions]

1. The diluted vaccine should be kept in cool and dark place and should be finished within 4 hours after dilution.
2. The used bottles, utensils and remaining vaccine shall be disinfected .

[Specification] 200, 400, 500 dose/vial.

[Package] 10 vials/box, 30 boxes/case.

[Storage and expiration] It is effective for two years stored below -15°C .
